#### Abstract

Genus two curves covering elliptic curves have been the object of study of many articles. For a fixed degree $n$ the subloci of the moduli space $\mathcal{M}_{2}$ of curves having a degree $n$ elliptic subcover has been computed for $n=3,5$ and discussed in detail for $n$ odd; see $[17,22,3,4]$. When the degree of the cover is even the case in general has been treated in [16]. In this paper we compute the sublocus of $\mathcal{M}_{2}$ of curves having a degree 4 elliptic subcover.

## 1. Introduction

Let $\psi: C \rightarrow E$ be a degree $n$ covering of an elliptic curve $E$ by a genus two curve $C$. Let $\pi_{C}: C \longrightarrow \mathbb{P}^{1}$ and $\pi_{E}: E \longrightarrow \mathbb{P}^{1}$ be the natural degree 2 projections. There is $\phi: \mathbb{P}^{1} \longrightarrow \mathbb{P}^{1}$ such that the diagram commutes.

The ramification of induced coverings $\phi: \mathbb{P}^{1} \longrightarrow \mathbb{P}^{1}$ can be determined in detail; see [16] for details. Let $\sigma$ denote the fixed ramification of $\phi: \mathbb{P}^{1} \longrightarrow \mathbb{P}^{1}$. The Hurwitz space of such covers is denoted by $\mathcal{H}(\sigma)$. For each covering $\phi: \mathbb{P}^{1} \longrightarrow \mathbb{P}^{1}$ (up to equivalence) there is a unique genus two curve $C$ (up to isomorphism). Hence, we
have a map

$$
\begin{align*}
\Phi: \mathcal{H}(\sigma) & \rightarrow \mathcal{M}_{2} \\
{[\phi] } & \rightarrow[C] . \tag{2}
\end{align*}
$$

We denote by $\mathcal{L}_{n}(\sigma)$ the image of $\mathcal{H}(\sigma)$ under this map. The main goal of this paper is to study $\mathcal{L}_{4}(\sigma)$.

## 2. Preliminaries

Most of the material of this section can be found in [23]. Let $C$ and $E$ be curves of genus 2 and 1, respectively. Both are smooth, projective curves defined over $k$, $\operatorname{char}(k)=0$. Let $\psi: C \longrightarrow E$ be a covering of degree $n$. From the RiemannHurwitz formula, $\sum_{P \in C}\left(e_{\psi}(P)-1\right)=2$ where $e_{\psi}(P)$ is the ramification index of points $P \in C$, under $\psi$. Thus, we have two points of ramification index 2 or one point of ramification index 3 . The two points of ramification index 2 can be in the same fiber or in different fibers. Therefore, we have the following cases of the covering $\psi$ :

Case I: There are $P_{1}, P_{2} \in C$, such that $e_{\psi}\left(P_{1}\right)=e_{\psi}\left(P_{2}\right)=2, \psi\left(P_{1}\right) \neq \psi\left(P_{2}\right)$, and $\forall P \in C \backslash\left\{P_{1}, P_{2}\right\}, e_{\psi}(P)=1$.

Case II: There are $P_{1}, P_{2} \in C$, such that $e_{\psi}\left(P_{1}\right)=e_{\psi}\left(P_{2}\right)=2, \psi\left(P_{1}\right)=\psi\left(P_{2}\right)$, and $\forall P \in C \backslash\left\{P_{1}, P_{2}\right\}, e_{\psi}(P)=1$.

Case III: There is $P_{1} \in C$ such that $e_{\psi}\left(P_{1}\right)=3$, and $\forall P \in C \backslash\left\{P_{1}\right\}, e_{\psi}(P)=1$.
In case I (resp. II, III) the cover $\psi$ has 2 (resp. 1) branch points in E.
Denote the hyperelliptic involution of $C$ by $w$. We choose $\mathcal{O}$ in E such that $w$ restricted to $E$ is the hyperelliptic involution on $E$. We denote the restriction of $w$ on $E$ by $v, v(P)=-P$. Thus, $\psi \circ w=v \circ \psi$. E[2] denotes the group of 2-torsion points of the elliptic curve E, which are the points fixed by $v$. The proof of the following two lemmas is straightforward and will be omitted.

Lemma 1. a) If $Q \in E$, then $\forall P \in \psi^{-1}(Q), w(P) \in \psi^{-1}(-Q)$.
b) For all $P \in C, e_{\psi}(P)=e_{\psi}(w(P))$.

Let $W$ be the set of points in C fixed by $w$. Every curve of genus 2 is given, up to isomorphism, by a binary sextic, so there are 6 points fixed by the hyperelliptic involution $w$, namely the Weierstrass points of $C$. The following lemma determines the distribution of the Weierstrass points in fibers of 2-torsion points.

Lemma 2. The following hold:
(1) $\psi(W) \subset E[2]$
(2) If $n$ is an even number then for all $Q \in E[2], \#\left(\psi^{-1}(Q) \cap W\right)=0 \bmod (2)$

Let $\pi_{C}: C \longrightarrow \mathbb{P}^{1}$ and $\pi_{E}: E \longrightarrow \mathbb{P}^{1}$ be the natural degree 2 projections. The hyperelliptic involution permutes the points in the fibers of $\pi_{C}$ and $\pi_{E}$. The ramified points of $\pi_{C}, \pi_{E}$ are respectively points in $W$ and $E[2]$ and their ramification index is 2 . There is $\phi: \mathbb{P}^{1} \longrightarrow \mathbb{P}^{1}$ such that the diagram commutes.

Next, we will determine the ramification of induced coverings $\phi: \mathbb{P}^{1} \longrightarrow \mathbb{P}^{1}$. First we fix some notation. For a given branch point we will denote the ramification of points in its fiber as follows. Any point $P$ of ramification index $m$ is denoted by $(m)$. If there are $k$ such points then we write $(m)^{k}$. We omit writing symbols for unramified points, in other words $(1)^{k}$ will not be written. Ramification data between two branch points will be separated by commas. We denote by $\pi_{E}(E[2])=$ $\left\{q_{1}, \ldots, q_{4}\right\}$ and $\pi_{C}(W)=\left\{w_{1}, \ldots, w_{6}\right\}$.

Let us assume now that $\operatorname{deg}(\psi)=n$ is an even number. Then the generic case for $\psi: C \longrightarrow E$ induce the following three cases for $\phi: \mathbb{P}^{1} \longrightarrow \mathbb{P}^{1}$ :
$\mathbf{I}:\left((2)^{\frac{n-2}{2}},(2)^{\frac{n-2}{2}},(2)^{\frac{n-2}{2}},(2)^{\frac{n}{2}},(2)\right)$
II: $\left((2)^{\frac{n-4}{2}},(2)^{\frac{n-2}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}},(2)\right)$
III: $\left((2)^{\frac{n-6}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}},(2)\right)$
Each of the above cases has the following degenerations (two of the branch points collapse to one)

I: (1) $\left((2)^{\frac{n}{2}},(2)^{\frac{n-2}{2}},(2)^{\frac{n-2}{2}},(2)^{\frac{n}{2}}\right)$
(2) $\left((2)^{\frac{n-2}{2}},(2)^{\frac{n-2}{2}},(4)(2)^{\frac{n-6}{2}},(2)^{\frac{n}{2}}\right)$
(3) $\left((2)^{\frac{n-2}{2}},(2)^{\frac{n-2}{2}},(2)^{\frac{n-2}{2}},(4)(2)^{\frac{n-4}{2}}\right)$
(4) $\left((3)(2)^{\frac{n-4}{2}},(2)^{\frac{n-2}{2}},(2)^{\frac{n-2}{2}},(2)^{\frac{n}{2}}\right)$

II: (1) $\left((2)^{\frac{n-2}{2}},(2)^{\frac{n-2}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}}\right)$
(2) $\left((2)^{\frac{n-4}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}}\right)$
(3) $\left((4)(2)^{\frac{n-8}{2}},(2)^{\frac{n-2}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}}\right)$
(4) $\left((2)^{\frac{n-4}{2}},(4)(2)^{\frac{n-6}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}}\right)$
(5) $\left((2)^{\frac{n-4}{2}},(2)^{\frac{n-2}{2}},(2)^{\frac{n-4}{2}},(2)^{\frac{n}{2}}\right)$
(6) $\left((3)(2)^{\frac{n-6}{2}},(2)^{\frac{n-2}{2}},(4)(2)^{\frac{n}{2}},(2)^{\frac{n}{2}}\right)$
(7) $\left((2)^{\frac{n-4}{2}},(3)(2)^{\frac{n-4}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}}\right)$

III: (1) $\left((2)^{\frac{n-4}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}},(4)(2)^{\frac{n}{2}}\right)$
(2) $\left((2)^{\frac{n-6}{2}},(4)(2)^{\frac{n-4}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}}\right)$
(3) $\left((2)^{\frac{n}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}},(4)(2)^{\frac{n-10}{2}}\right)$
(4) $\left((3)(2)^{\frac{n-8}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}},(2)^{\frac{n}{2}}\right)$

For details see [16].

## 3. Degree 4 Case

In this section we focus on the case $\operatorname{deg}(\phi)=4$. The goal is to determine all ramifications $\sigma$ and explicitly compute $\mathcal{L}_{4}(\sigma)$.

There is one generic case and one degenerate case in which the ramification of $\operatorname{deg}(\phi)=4$ applies, as given by the above possible ramification structures:
i) $\left(2,2,2,2^{2}, 2\right)$ (generic)
ii) $(2,2,2,4)$ (degenerate)

## 4. Computing the locus $\mathcal{L}_{4}$ in $\mathcal{M}_{2}$

4.1. Non-degenerate case. Let $\psi: C \longrightarrow E$ be a covering of degree 4 , where $C$ is a genus 2 curve and $E$ is an elliptic curve. Let $\phi$ be the Frey-Kani covering with $\operatorname{deg}(\phi)=4$ such that $\phi(1)=0, \phi(\infty)=\infty, \phi(p)=\infty$ and the roots of $f(x)=x^{2}+a x+b$ be in the fiber of 0 . In the following figure, bullets (resp., circles) represent places of ramification index 2 (resp., 1).

Figure 1. Degree 4 covering for generic case

Then the cover can be given by

$$
\phi(x)=\frac{k(x-1)^{2}\left(x^{2}+b\right)}{(x-p)^{2}} .
$$

Let $\lambda$ be a 2 -torsion point of $E$. To find $\lambda$, we solve

$$
\begin{equation*}
\phi(x)-\lambda=0 \tag{4}
\end{equation*}
$$

According to this ramification we should have 3 solutions for $\lambda$, say $\lambda_{1}, \lambda_{2}, \lambda_{3}$. The discriminant of the Eq. (4) gives branch points for the points with ramification index 2 . So we have the following relation for $\lambda$, with $p \neq 1$.

$$
\begin{aligned}
& \left(-b-p^{2}\right) \lambda^{3}+\left(2 k p^{2}-18 k b p+16 k p^{4}-16 k p^{3}+3 k b^{2}+3 k b+20 k b p^{2}\right) \lambda^{2} \\
& (5) \quad+\left(-3 k^{2} b+21 k^{2} b^{2}-36 k^{2} b^{2} p-3 k^{2} b^{3}-20 k^{2} b p^{2}+8 k^{2} b^{2} p^{2}+18 k^{2} b p\right. \\
& \left.\quad-k^{2} p^{2}\right) \lambda+k^{3} b+k^{3} b^{4}+3 k^{3} b^{2}+3 k^{3} b^{3}=0
\end{aligned}
$$

Using Eq.(4) and Eq.(5) we find the degree 12 equation with 2 factors. One of them with degree 6 corresponds to the equation of genus 2 curve and the other corresponds to the double roots in the fiber of $\lambda_{1}, \lambda_{2}$ and $\lambda_{3}$.

The equation of genus 2 curve can be written as follows:

$$
C: y^{2}=a_{6} x^{6}+a_{5} x^{5}+a_{4} x^{4}+a_{3} x^{3}+a_{2} x^{2}+a_{1} x+a_{0}
$$

where

$$
\begin{aligned}
& a_{6}=p^{2}+b \\
& a_{5}=4 p^{3}-6 p^{2}+4 p b-6 b \\
& a_{4}=-4 p^{4}-10 p^{3}+(-5 b+13) p^{2}-8 p b+12 b \\
& a_{3}=12 p^{4}+(4+6 b) p^{3}+(-12+12 b) p^{2}+\left(8 b^{2}-6 b\right) p-8 b-8 b^{2} \\
& a_{2}=(-11-4 b) p^{4}+(-20 b+6) p^{3}+\left(4+13 b-12 b^{2}\right) p^{2}+10 p b+12 b^{2} \\
& a_{1}=(14 b+2) p^{4}+\left(6 b^{2}-4+4 b\right) p^{3}+\left(-24 b+6 b^{2}\right) p^{2}+\left(-6 b^{2}+4 b\right) p-6 b^{2} \\
& a_{0}=\left(-b^{2}+1-11 b\right) p^{4}+\left(14 b-2 b^{2}\right) p^{3}-2 b p^{2}+2 b^{2} p+b^{2}
\end{aligned}
$$

Notice that we write the equation of genus 2 curve in terms of only 2 unknowns. We denote the Igusa invariants of $C$ by $J_{2}, J_{4}, J_{6}$, and $J_{10}$. The absolute invariants of $C$ are given in terms of these classical invariants:

$$
i_{1}=144 \frac{J_{4}}{J_{2}^{2}}, \quad i_{2}=-1728 \frac{J_{2} J_{4}-3 J_{6}}{J_{2}^{3}}, \quad i_{3}=486 \frac{J_{10}}{J_{2}^{5}}
$$

Two genus 2 curves with $J_{2} \neq 0$ are isomorphic if and only if they have the same absolute invariants. Notice that these invariants of our genus 2 curve are polynomials in $p$ and $b$. By using a computational symbolic package (as Maple) we eliminate $p$ and $b$ to determine the equation for the non-degenerate locus $\mathcal{L}_{4}$. The result is very long. We don't display it here.

## 5. Degenerate Case

Notice that only one degenerate case can occur when $n=4:(2,2,2,4)$. In this case one of the Weierstrass points has ramification index 3 , so the cover is totally ramified at this point.

Let the branch points be $0,1, \lambda$, and $\infty$, where $\infty$ corresponds to the element of index 4 . Then, above the fibers of $0,1, \lambda$ lie two Weierstrass points. The two Weierstrass points above 0 can be written as the roots of a quadratic polynomial $x^{2}+a x+b$; above 1 , they are the roots of $x^{2}+p x+q$; and above $\lambda$, they are the roots of $x^{2}+s x+t$. This gives us an equation for the genus 2 curve $C$ :

$$
C: y^{2}=\left(x^{2}+a x+b\right)\left(x^{2}+p x+q\right)\left(x^{2}+s x+t\right)
$$

The four branch points of the cover $\phi$ are the 2 -torsion points $E[2]$ of the elliptic curve $E$, allowing us to write the elliptic subcover as

$$
E: y^{2}=x(x-1)(x-\lambda)
$$

The cover $\phi: \mathbb{P}^{1} \rightarrow \mathbb{P}^{1}$ is Frey-Kani covering and is given by

$$
\phi(x)=c x^{2}\left(x^{2}+a x+b\right)
$$

Using $\phi(1)=1$, we get $c=\frac{1}{1+a+b}$. Then,

$$
\phi(x)-1=c(x-1)^{2}\left(x^{2}+p x+q\right)
$$

This implies that $\phi^{\prime}(1)=0$, so we get $c(4+3 a+2 b)=0$. Since $c$ cannot be 0 , we must have $4+3 a+2 b=0$, which implies $a=\frac{-2(b+2)}{3}$. Combining this with our equation for $c$, we get $c=\frac{3}{b-1}$.

Now, since $\phi(x)-1-c(x-1)^{2}\left(x^{2}+p x+q\right)=0$, we want all of the coefficients of this polynomial to be identically 0 ; thus

$$
p=\frac{2(1-b)}{3}, q=\frac{1-b}{3}
$$

Finally, we consider the fiber above $\lambda$. We write

$$
\phi(x)-\lambda=c(x-r)^{2}\left(x^{2}+s x+t\right) .
$$

Similar to above, we set the coefficients of the polynomial to 0 to get:

$$
\lambda=\frac{b^{3}(4-b)}{16(b-1)}, \quad r=\frac{b}{2}, \quad s=\frac{b-4}{3}, \quad t=\frac{b(b-4)}{12} .
$$

Hence we have $C$ and $E$ with equations:

$$
\begin{align*}
C: & y^{2}=\left(\frac{1-b}{3}+\frac{2}{3}(1-b) x+x^{2}\right)\left(\frac{1}{12}(b-4) b+\frac{1}{3}(b-4) x+x^{2}\right) \\
& \left(b-\frac{2}{3}(b+2) x+x^{2}\right)  \tag{6}\\
E: & v^{2}=u(u-1)\left(u-\frac{b^{3}(4-b)}{16(b-1)}\right)
\end{align*}
$$

where the corresponding discriminants of the right sides must be non-zero. Hence,

$$
\begin{align*}
\Delta_{C} & :=b(b-4)(b-2)(b-1)(2+b) \neq 0  \tag{7}\\
\Delta_{E} & :=\frac{(b-4)^{2}(b-2)^{6} b^{6}(b+2)^{2}}{65536(b-1)^{4}} \neq 0 \tag{8}
\end{align*}
$$

From here on, we consider the additional restriction on $b$ that it does not solve $J_{2}=0$, that is,
(9) $\quad J_{2}=-\frac{5}{486}\left(256-384 b-4908 b^{2}+5068 b^{3}-1227 b^{4}-24 b^{5}+4 b^{6}\right) \neq 0$.

The case when $J_{2}=0$ is considered separately. We can eliminate $b$ from this system of equations by taking the numerators of $i_{j}-i_{j}(b)$ and setting them equal to 0 , where $i_{j}$ are absolute invariants of genus 2 curve.

Thus, we have 3 polynomials in $b, i_{1}, i_{2}, i_{3}$. We eliminate $b$ using the method of resultants and get the following:

$$
\begin{array}{r}
3652054494822999-312800728170302145 i_{1}-247728254774362875 i_{1}^{2} \\
+3039113062253125 i_{1}^{3}-522534367747902600 i_{2}-28017734537115000 i_{1} i_{2}  \tag{10}\\
-238234372300000 i_{2}^{2}=0
\end{array}
$$

and the other equation

$$
\begin{align*}
& 1158391804615233525 i_{1}-17653298856896250 i_{1}^{2}+100894442906250 i_{1}^{3} \\
& -256292578125 i_{1}^{4}+244140625 i_{1}^{5}-323890167989102732668800000 i_{3} \\
& -14879672225288904960000000 i_{1} i_{3}-40609431102258000000000 i_{1}^{2} i_{3}  \tag{11}\\
& \quad-16677181699666569+347405361918358396861440000000000 i_{3}^{2}=0
\end{align*}
$$

These equations determine the degenerate locus $\mathcal{L}_{4}^{\prime}$ when $J_{2} \neq 0$.

When $J_{2}=0$, we must resort to the $a$-invariants of the genus 2 curve. These invariants are defined as

$$
a_{1}=\frac{J_{4} J_{6}}{J_{10}}, \quad a_{2}=\frac{J_{10} J_{6}}{J_{4}^{4}}
$$

Two genus 2 curves with $J_{2}=0$ are isomorphic iff their $a$-invariants are equal. For our genus 2 curve,

$$
\begin{aligned}
J_{4} & =\frac{1}{5184}\left(65536-196608 b-307200 b^{2}+1218560 b^{3}-834288 b^{4}-294432 b^{5}\right. \\
& \left.+456600 b^{6}-73608 b^{7}-52143 b^{8}+19040 b^{9}-1200 b^{10}-192 b^{11}+16 b^{12}\right)
\end{aligned}
$$

It can be guarantee that $J_{4}$ and $J_{2}$ are not simultaneously 0 because the resultant of these two polynomials in $b$ is

$$
\frac{11784978051522395707646672896000000000000}{42391158275216203514294433201}
$$

so there are no more subcases. We want to eliminate $b$ from the set of equations:

$$
\begin{aligned}
J_{2} & =0 \\
a_{1}-a_{1}(b) & =0 \\
a_{2}-a_{2}(b) & =0
\end{aligned}
$$

Similar to what we did above with the $i$-invariants, we take resultants of combinations of these and set them equal to 0 . Doing so tells us

$$
\begin{aligned}
& 20 a_{1}-55476394831=0 \\
& 1022825924657928 a_{2}-522665=0
\end{aligned}
$$

So in other words, if $C$ is a genus 2 curve with a degree 4 elliptic subcover with $J_{2}=0$, then

$$
a_{1}=\frac{55476394831}{20}, \quad a_{2}=\frac{522665}{1022825924657928}
$$

So up to isomorphism, this is the only genus 2 curve with degree 4 elliptic subcover with $J_{2}=0$. In this case the equation of the genus 2 curve is given by Eq.(6), where $b$ is given by the following:

$$
\begin{equation*}
b=\frac{2 \alpha+\sqrt{429 \alpha^{2}+60123 \alpha+\beta}}{2 \alpha} \tag{12}
\end{equation*}
$$

with $\alpha=\sqrt[3]{2837051+9408 i \sqrt{5}}$ and $\beta=8511153+28224 i \sqrt{5}$. We summarize the above results in the following theorem.

Theorem 1. Let $C$ be a genus 2 curve with a degree 4 degenerate elliptic subcover. Then $C$ is isomorphic to the curve given by Eq.(6) where b satisfies Eq.(12) or its absolute invariants satisfy Eq. (10) and Eq. (11).

Remark 1. The genus 2 curve, when $J_{2}=0$, is not defined over the rational.

Remark 2. When the genus 2 curve has non zero $J_{2}$ invariant the $j$ invariant of the elliptic curve satisfies the following equation:

$$
\begin{aligned}
0= & \left(2621440000000000 J_{4}{ }^{4}-14332985344000000 J_{2}{ }^{2} J_{4}{ }^{3}-15871355368243200 J_{2}{ }^{6} J_{4}\right. \\
& \left.+1586874322944 J_{2}{ }^{8}+26122821304320000 J_{2}{ }^{4} J_{4}{ }^{2}\right) j^{2}+\left(-2535107603331605760 J_{2}{ }^{8}\right. \\
& +25102192337335536076800 J_{2}{ }^{6} J_{4}-164781024264192000000000 J_{4}{ }^{4} \\
& \left.+90675809529498685440000 J_{2}{ }^{4} J_{4}{ }^{2}-363163522083397632000000 J_{2}{ }^{2} J_{4}{ }^{3}\right) j \\
& +2589491458659766450406400000000 J_{4}{ }^{4}-203482361042468209670400000000 J_{2}{ }^{2} J_{4}{ }^{3} \\
& +39862710766802552045625 J_{2}{ }^{8}-19433806326190741141800000 J_{2}{ }^{6} J_{4} \\
& +3259543004362746907416000000 J_{2}{ }^{4} J_{4}{ }^{2} .
\end{aligned}
$$

5.1. Genus 2 curves with degree 4 elliptic subcovers and extra automorphisms in the degenerate locus of $\mathcal{L}_{4}$. In any characteristic different from 2, the automorphism group $\operatorname{Aut}(\mathrm{C})$ is isomorphic to one of the groups: $C_{2}, C_{10}, V_{4}$, $D_{8}, D_{12}, C_{3} \rtimes D_{8}, G F_{2}(3)$, or $2^{+} S_{5}$; See [21] for the description of each group. We have the following lemma.

Lemma 3. (a) The locus $\mathcal{L}_{2}$ of genus 2 curves $C$ which have a degree 2 elliptic subcover is a closed subvariety of $\mathcal{M}_{2}$. The equation of $\mathcal{L}_{2}$ is given by

$$
\begin{align*}
0 & =8748 J_{10} J_{2}^{4} J_{6}^{2}-507384000 J_{10}^{2} J_{4}^{2} J_{2}-19245600 J_{10}^{2} J_{4} J_{2}^{3}-592272 J_{10} J_{4}^{4} J_{2}^{2}  \tag{13}\\
& +77436 J_{10} J_{4}^{3} J_{2}^{4}-3499200 J_{10} J_{2} J_{6}^{3}+4743360 J_{10} J_{4}^{3} J_{2} J_{6}-870912 J_{10} J_{4}^{2} J_{2}^{3} J_{6} \\

\end{align*}
$$

(b) The locus $\mathcal{M}_{2}\left(D_{8}\right)$ of genus 2 curves $C$ with $A u t(C) \equiv D_{8}$ is given by the equation of $\mathcal{L}_{2}$ and

$$
\begin{equation*}
0=1706 J_{4}^{2} J_{2}^{2}+2560 J_{4}^{3}+27 J_{4} J_{2}^{4}-81 J_{2}^{3} J_{6}-14880 J_{2} J_{4} J_{6}+28800 J_{6}^{2} \tag{14}
\end{equation*}
$$

(c) The locus $\mathcal{M}_{2}\left(D_{12}\right)$ of genus 2 curves $C$ with $\operatorname{Aut}(C) \equiv D_{12}$ is

$$
\begin{align*}
0=- & J_{4} J_{2}^{4}+12 J_{2}^{3} J_{6}-52 J_{4}^{2} J_{2}^{2}+80 J_{4}^{3}+960 J_{2} J_{4} J_{6}-3600 J_{6}^{2}  \tag{15}\\
0=- & 864 J_{10} J_{2}^{5}+3456000 J_{10} J_{4}^{2} J_{2}-43200 J_{10} J_{4} J_{2}^{3}-2332800000 J_{10}^{2}  \tag{16}\\
& -J_{4}^{2} J_{2}^{6}-768 J_{4}^{4} J_{2}^{2}+48 J_{4}^{3} J_{2}^{4}+4096 J_{4}^{5}
\end{align*}
$$

We will refer to the locus of genus 2 curves C with $\operatorname{Aut}(C) \equiv D_{12}$ (resp., $\operatorname{Aut}(C) \equiv D_{8}$ ) as the $D_{12}$-locus (resp., $D_{8}$-locus).

Equations (10), (11), and (13) determine a system of 3 equations in the $3 i$ invariants. The set of possible solutions to this system contains 20 rational points and 8 irrational or complex points (there may be more possible solutions, but finding them involves the difficult task of solving a degree 15 or higher polynomial).

Among the 20 rational solutions, there are four rational points which actually solve the system.

$$
\begin{aligned}
\left(i_{1}, i_{2}, i_{3}\right) & =\left(\frac{102789}{12005}, \frac{-73594737}{2941225}, \frac{531441}{28247524900000}\right) \\
\left(i_{1}, i_{2}, i_{3}\right) & =\left(\frac{66357}{9245}, \frac{-892323}{46225}, \frac{7776}{459401384375}\right) \\
\left(i_{1}, i_{2}, i_{3}\right) & =\left(\frac{235629}{1156805}, \frac{-28488591}{214008925}, \frac{53747712}{80459143207503125}\right) \\
\left(i_{1}, i_{2}, i_{3}\right) & =\left(\frac{1078818669}{383775605}, \frac{-77466710644803}{16811290377025}, \frac{1356226634181762}{161294078381836186878125}\right)
\end{aligned}
$$

Of these four points, only the first one lies on the $D_{12}$-locus, and none lie on the $D_{8}$-locus, so the other three curves have automorphism groups isomorphic to $V_{4}$ (See Remark 3 for their equations). We have the following proposition.

Proposition 1. There is exactly one genus 2 curve $C$ defined over $\mathbb{Q}$ (up to $\mathcal{C}$ isomorphism) with a degree 4 elliptic subcover which has an automorphism group $D_{12}$ namely the curve

$$
C=100 X^{6}+100 X^{3}+27
$$

and no such curves with automorphism group $D_{8}$.
Proof. From above discussion there is exactly one rational point which lies on the $D_{12}$-locus and three rational points which lies on the $V_{4}$-locus. Furthermore we have the fact that $\operatorname{Aut}(C) \equiv D_{12}$ if and only if $C$ is isomorphic to the curve given by $Y^{2}=X^{6}+X^{3}+t$ for some $t \in k$; see [19] for more details.

Suppose the equation of the $D_{12}$ case is $Y^{2}=X^{6}+X^{3}+t$. We want to find $t$. We can calculate the $i$-invariants in terms of $t$ accordingly, so we get a system of equations, $i_{j}-i_{j}(t)=0$ for $j \in\{1,2,3\}$. Those equations simplify to the following:

$$
\begin{aligned}
& 0=1600 i_{1} t^{2}-80 i_{1} t+i_{1}-6480 t^{2}-1296 t \\
& 0=64000 i_{2} t^{3}-4800 i_{2} t^{2}+120 i_{2} t-i_{2}+233280 t^{3}+303264 t^{2}-11664 t \\
& \begin{array}{c}
0=1638400000 i_{3} t^{5}-204800000 i_{3} t^{4}+10240000 i_{3} t^{3}-256000 i_{3} t^{2} \\
\quad \quad+3200 i_{3} t-16 i_{3}+729 t^{2}+34992 t^{2}-46656 t^{5}-8748 t^{3}
\end{array}
\end{aligned}
$$

Replacing our i-invariants into the above system of equations we get:

$$
\begin{aligned}
0= & 86670000 t^{2}-23781600 t+102789 \\
0= & -4023934200000 t^{3}+1245222396000 t^{2}-43137816840 t+73594737 \\
0= & -82315363050000000 t^{5}+61770534511500000 t^{4}-15443994116835000 t^{3} \\
& \quad+1287019350200250 t^{2}+106288200 t-531441
\end{aligned}
$$

There is only root those three polynomials share: $t=\frac{27}{100}$. Thus, there is exactly one genus 2 curve $C$ defined over $Q$ (up to $Q$-isomorphism) with a degree 4 elliptic subcover which has an automorphism group $D_{12}$

$$
C: \quad y^{2}=100 X^{6}+100 X^{3}+27
$$

Similarly, we show that there are no such curves with automorphism group $D_{8}$.

Remark 3. There are at least three genus 2 curves defined over $\mathbb{Q}$ with automorphism group $V_{4}$. The equations of these curves are given by the followings:

Case 1: $\left(i_{1}, i_{2}, i_{3}\right)=\left(\frac{66357}{9245}, \frac{-892323}{46225}, \frac{7776}{459401384375}\right)$

$$
\begin{aligned}
C & : y^{2}=1432139730944 x^{6}+34271993769359360 x^{5}+267643983706245216000 x^{4} \\
& +1267919172426862313120000 x^{3}+23945558970224886213835350000 x^{2} \\
& +274330666162649153793599380475000 x+1025623291911204380755800513010015625 .
\end{aligned}
$$

Case 2: $\left(i_{1}, i_{2}, i_{3}\right)=\left(\frac{235629}{1156805}, \frac{-28488591}{214008925}, \frac{53747712}{80459143207503125}\right)$

$$
\begin{aligned}
C & : \\
y^{2} & =41871441565158964373437321767075023159296 x^{6} \\

\end{aligned}
$$

We summarize by the following:
Theorem 2. Let $\psi: C \rightarrow E$ be a degree 4 covering of an elliptic curve by a genus 2 curve. Then the following hold:
i) In the generic case the equation of $C$ can be written as follows:

$$
C: y^{2}=a_{6} x^{6}+a_{5} x^{5}+\cdots+a_{1} x+a_{0}
$$

where

$$
\begin{aligned}
& a_{6}=p^{2}+b \\
& a_{5}=4 p^{3}-6 p^{2}+4 p b-6 b \\
& a_{4}=-4 p^{4}-10 p^{3}+(-5 b+13) p^{2}-8 p b+12 b \\
& a_{3}=12 p^{4}+(4+6 b) p^{3}+(-12+12 b) p^{2}+\left(8 b^{2}-6 b\right) p-8 b-8 b^{2} \\
& a_{2}=(-11-4 b) p^{4}+(-20 b+6) p^{3}+\left(4+13 b-12 b^{2}\right) p^{2}+10 p b+12 b^{2} \\
& a_{1}=(14 b+2) p^{4}+\left(6 b^{2}-4+4 b\right) p^{3}+\left(-24 b+6 b^{2}\right) p^{2}+\left(-6 b^{2}+4 b\right) p-6 b^{2} \\
& a_{0}=\left(-b^{2}+1-11 b\right) p^{4}+\left(14 b-2 b^{2}\right) p^{3}-2 b p^{2}+2 b^{2} p+b^{2} .
\end{aligned}
$$

ii) In the degenerate case the equation of $\mathcal{L}_{4}^{\prime}$ is given by

$$
\begin{array}{r}
1541086152812576000{J_{2}}^{2} J_{4}{ }^{2}-22835312232360960000 J_{2} J_{4} J_{6}+5009676947631 J_{2}{ }^{6} \\
-8782271900467200000{J_{6}}^{2}+1176812184652746480 J_{2}{ }^{4} J_{4}+12448207102988800000 J_{4}{ }^{3} \\
-3715799948429529600 J_{2}{ }^{3} J_{6}=0
\end{array}
$$

$$
1866265600000000 J_{2}^{2} J_{4}^{4}+1389621447673433587445760000000000 J_{10}{ }^{2}+282429536481 J_{2}^{10}
$$

$$
\begin{array}{r}
+6199238007360000 J_{2}{ }^{6} J_{4}{ }^{2}-256000000000000 J_{4}{ }^{5}-2824915237592400 J_{2}{ }^{8} J_{4} \\
+2665762699498787923200000 J_{2}{ }^{5} J_{10}-5102020224000000 J_{2}{ }^{4} J_{4}{ }^{3} \\
+6930676241452032000000000 J_{2} J_{4}{ }^{2} J_{10}+17635167081823887360000000 J_{2}{ }^{3} J_{4} J_{10}=0
\end{array}
$$

iii) The intersection $\mathcal{L}_{4}^{\prime} \cap \mathcal{M}_{2}\left(D_{8}\right)=\emptyset$ and the intersection $\mathcal{L}_{4}^{\prime} \cap \mathcal{M}_{2}\left(D_{12}\right)$ contains a single point, namely the curve

$$
C: \quad y^{2}=100 X^{6}+100 X^{3}+27
$$
